

THE BEST PALO ALTO CONSULTING SERVICES FOR YOUR BUSINESS

Technology is changing business. And business is changing technology. This fast-paced evolution is leading customers to demand new ways to protect their companies from increasingly advanced security threats.

We're here to provide that protection.

Your Next-Generation Firewall Experts

SecureIT Consult offers expert next generation firewall consultancy services designed to support your business, whether you're upgrading your current provision or looking to migrate to a new network security system.

Our consultants are professionals with expertise in network security and Palo Alto products.

We work to tried, tested, and trusted processes and methods that have shown they can provide successful security solutions for all kinds of clients. You could be next.

DEPLOYMENT ASSISTANCE

Time has always been money. SecureITConsult consultants will show you how to hit the accelerator on your production projects, bringing risk-reducing design skills and assistance to deliver comprehensive and reliable project implementation that's bespoke to your needs.

MANAGEMENT ASSISTANCE

Often, configuration changes are unavoidable. If that's the situation you face, our teams have the expertise to minimise the risk of these causing disruption to your daily operations and help ensure a successful outcome.

PRODUCT IMPLEMENTATION

You'll want the best protection for your business. So hire the best Palo Alto consultants. Ours provide assistance for your company on-site, sharing our next-generation firewall product expertise via a road map to implementation created just for your business. Although the content will differ, each of our projects follows the same structure:

- ASSESSMENT of your current business and technology provision and future needs

- DESIGN of solutions and implementation strategies
- INSTALLATION and CONFIGURATION of solutions
- MIGRATION of legacy systems to a next generation Palo Alto Networks solution
- AUDIT and TUNING

Assessment

We'll carry out a detailed analysis of your current technology set-up, paying specific attention to your security architecture and business environment.

Design, install, and configure

The findings of our assessment will influence the nature of the next generation firewall we'll design, install, configure, and fine-tune for your business.

Migration

We can work with the security rules inherent in your current firewall and apply them to your new system with no reconfiguration required. That will save time and substantially reduce risk.

Testing & acceptance

Our team provides a comprehensive support service during the critical time when your project moves into production. Key to success here is the post production implementation review that we'll arrange. This will confirm the project's success, iron-out any remaining issues, and finalise your configuration.

Our approach is proven to save our customers time. And we're not talking just a few hours or days here and there. We expect to cut weeks or even months out of the time it takes others to install and evolve next generation firewalls.

Next Generation Firewall Installation Services

Planning a new firewall is one thing. Installing network security products is another thing entirely. It's one of the most vital processes any business can undertake. Given its importance, only the most experienced of engineers should be relied upon. And they are here at SecureITConsult.

Calling on your in-house experts to carry out the installation isn't always the most efficient use of your resources. Your team is likely to be distracted by other projects and lack the time to attend training sessions or meet installation deadlines. Our teams will focus from start to finish on one thing—brilliantly, securely, and swiftly installing your new network.

We offer a cost effective option to quickly and comprehensively install a next generation firewall. This service covers:

- ▶ Planning
- ▶ Installation
- ▶ Licensing & product registration
- ▶ Interface configuration
- ▶ Demonstration of key product features

SecureITConsult will designate an experienced installation consultant to carry out every phase of the process. They will also ensure your key team members are fully versed in how to manage the system once it's installed.

Change Management Services

In terms of security, change usually means adapting to new business requirements, introducing new tech, upgrading current products. Of course, you may well have reservations about introducing any change because of the risk that brings. Totally understandable. But we're here to help, via our Change Impact & Validation service. This clearly shows you the impact your proposed changes will have BEFORE the project begins, allowing everyone involved to take steps to minimize associated risks and ensure a positive outcome.

We'll start by assigning you a next-generation firewall expert to work in partnership with your team and:

- ▶ Assess the planned changes and the business reasons for them
- ▶ Discuss design principles and gauge your requirements
- ▶ Create a test plan for change validation, in line with established best practices
- ▶ Replicate your environment and apply the changes
- ▶ Carry out the test plan, analyse the results, and communicate the findings

Following this process saves you time and money as it eliminates the waste of making unnecessary changes, while validating the impact of the change programme BEFORE moving into the production phase.

Service Optimisation

It's rarely (if ever) the case that your business will adopt a new technology solution and that will be that. Done and dusted. Your needs will evolve, your business security challenges will change, new threats will emerge and need to be countered. So you need a network security solution that's versatile enough to adapt to your ever-changing needs. Optimisation services from SecureITConsult are designed to bring that versatility to your next generation firewall. Let our expert consultants use their product and best practice know-how to ensure your security network is ready for whatever lies ahead.

Configuration Review and Optimisation Service

This is a popular service in which our expert Palo Alto Networks consultants use their knowledge to identify the best changes you can make to your next generation firewall to deliver the optimum results. Your project will follow our tried and tested pathway to success:

STEP 1:

We'll work with you to assess your current next generation firewall set-up. This will result in a validation of the best platform to match your current performance requirements. We will also map out a migration plan to meet your changing needs, and review the management and log monitoring options that are available to you via Palo Alto Networks.

STEP 2:

Our expert consultant will then analyse the system you have in place, gathering performance data and reviewing the firewall's parameters, notably your:

- ▶ Sessions
- ▶ Drops
- ▶ Resources
- ▶ Traffic
- ▶ Threats
- ▶ System logs

The goal here is to verify if your firewall is performing at optimum levels and recommend changes where applicable.

STEP 3:

The configuration audit phase entails our consultant reviewing the current or proposed next generation firewall configuration. Performance will be compared with current best practice, and we will inform you of ways to improve the performance via upgrades, if applicable. Our consultant will happily show your team how to make the use of any new configurations. And we can implement all changes if required.

Whenever you need our next generation firewall services, the SecureITConsult Palo Alto team is always ready to help. We know how to save your business time. Give you the peace of mind you seek by reducing risk. And we always offer great value for money. To find out more and/or to book one of our services, please contact us.
